X-ray diffraction

ABSTRACT

The data presented in this article are related to the formation of a novel layered perovskite oxide material, $\text{PrSrMn}_2\text{O}_{5+\delta}$, through a solid-state synthesis route. Here, we present the high-resolution neutron powder diffraction and the X-ray powder diffraction data at room temperature. The new perovskite material crystallizes in the orthorhombic symmetry. Interpretation of this data can be found in a research article titled "Insight of novel layered perovskite $\text{PrSrMn}_2\text{O}_{5+\delta}$: A neutron powder diffraction study" (Shammya et al., 2019) [1].

Specifications Table

Subject area	Material science
More specific subject area	Layered perovskite-type oxide - ceramic Material
Type of data	Figure, raw data and analyzed data, table
How data was acquired	Neutron powder diffraction data were obtained on a Polaris instrument, the X-ray diffraction (XRD) data were collected on a Bruker AXS D8 Advance diffractometer.
Data format	Raw (neutron data:.gsas), txt and dat
Experimental factors	Powder sample
Experimental features	Neutron powder diffraction experiment was started when pressure measured approximately 1 mbar. Neutron data on 90° bank (up to 4.1 Å) was collected over one hour at room temperature. For the X-ray powder diffraction, the sample was measured over a 2θ interval from 10° to 79.995° with a step size of 0.02
Data source location	High-resolution neutron powder diffraction data were collected on the time-of-flight instrument Polaris at the ISIS Pulsed Neutron & Muon Source Institution: Rutherford Appleton Laboratory City/Town/Region: Harwell Campus, OX11 0QX Country: United Kingdom and the XRD data were collected at Department of Chemistry and Chemical Engineering Laboratory Institution: Chalmers University of Technology City/Town/Region: SE-412 96 Gothenburg Country: Sweden
Data accessibility	Data is with the article
Related research article	Shammya Afroze, Nico Torino, Paul Henry, Md Sumon Reza, Quentin Cheok, Abul K. Azad, Insight of novel layered perovskite PrSrMn ² O _{5+δ} : A neutron powder diffraction study, Materials Letters, DOI: 10.1016/j.matlet.2019.127126 [1]

Value of the data

- The data provides detailed information on how to investigate crystal symmetry, space group, lattice parameter, atomic positions of a layered-type perovskite oxide material.
- Data to be used on understanding to observe its structural properties using a range of techniques.
- The method and structural model analysis are worthy of being applied to other types of perovskite-type oxide materials.

1. Data

The new layered perovskite material, PrSrMn₂O_{5+δ}, was synthesized by solid-state reaction to investigate the structural behavior. X-ray and neutron powder diffraction data were presented at room temperature in Figs. 1 and 2. The XRD pattern of the sample was shown the same crystalline nature of the ceramic material. The XRD pattern was obtained at room temperature for the above sample. To understand the structure of the sample behavior, neutron powder diffraction was also carried out on PrSrMn₂O_{5+δ} sample at room temperature. A small impurity phase was detected and the percentage of impurity was ~2% for MnO₂. The neutron diffraction pattern is perfectly fitted with the orthorhombic layered perovskite structure in the *Pmmm* space-group yielding, *a* = 3.8907 (1) Å, *b* = 3.8227 (1) Å, and *c* = 7.6846 (2) Å, with dimensions *a_p* × *a_p* × 2*a_p*. The dimensions were chosen on the basis of X-ray and neutron powder diffraction studies.

The impurity phase for MnO₂ also obtained the same crystalline symmetry (orthorhombic symmetry with space group, *Pnma*). The XRD and neutron diffraction patterns are perfectly matched with cell parameter, *a* = 9.2451 (1) Å, *b* = 3.1108 (1) Å and *c* = 4.3475 (2) Å. What are also presented in the article are the detailed neutron powder diffraction data and atomic coordinates (Table 1).

2. Experimental design, materials, and methods

2.1. Materials and methods

PrSrMn₂O_{5+δ} was prepared by solid-state reaction, using carbonate and oxides: Pr₆O₁₁ (≥99.99%, Aldrich), SrCO₃ (≥99.9%, Aldrich) and MnO (≥99.5%, Aldrich). The obtained powders were annealed at

Fig. 1. Raw XRD pattern of $\text{PrSrMn}_2\text{O}_{5+\delta}$ composition sintered at 1400 °C for 12 h in Ar.

1000 °C for 10 hours. Stoichiometric mixtures were prepared by manually grinding the reactants in an agate mortar-pestle, with ethanol as a suspending agent. The finely mixed powders were pressed into pellets and fired at 1200 °C in α -alumina crucibles for 12 hrs, then intensively grounded and pelletized again. The pellet was finally re-sintered for another 12 hrs at 1400 °C, with intermediate grinding and pelletizing. The samples were exposed to a stepwise temperature programme, using the method described in a previous study [2,3].

2.2. Neutron powder diffraction

Neutron powder diffraction data were collected on the time-of-flight instrument Polaris at the ISIS neutron and muon source, UK [4]. The samples were loaded into open, cylindrical 8mm external diameter vanadium can. Time-of-flight powder diffraction data were obtained using the raw format

Fig. 2. Raw neutron powder diffraction data collected on 90° bank at room temperature.

Table 1
Structural parameters for as-prepared PrSrMn₂O_{5+δ} at RT with orthorhombic structure.

Parameters	PrSrMn ₂ O _{5+δ} at RT
Structure model	PrSrMn ₂ O _{5+δ}
Crystal system	Orthorhombic
Space group	<i>Pmmm</i>
Volume (Å ³)	480.9290 (0)
Density (gm/cm ³)	6.9870 (1)
Cell parameters	
a (Å)	3.8906 (1), α = 90°
b (Å)	3.8227 (1), β = 90°
c (Å)	7.6846 (2), γ = 90°
Atomic positions	
Pr (x, y, z)	(0.5000, 0.5000, 0.0000)
Sr (x, y, z)	(0.5000, 0.5000, 0.5000)
Mn (x, y, z)	(0.0000, 0.0000, 0.7547)
O1 (x, y, z)	(0.0000, 0.5000, 0.2522)
O2 (x, y, z)	(0.5000, 0.0000, 0.2517)
O3 (x, y, z)	(0.0000, 0.0000, 0.5000)
Structure model	MnO ₂
Crystal system	Orthorhombic
Space group	<i>Pnma</i>
Volume (Å ³)	131.7360 (0)
Density (gm/cm ³)	1.7500 (1)
Cell parameters	
a (Å)	9.2451 (1), α = 90°
b (Å)	3.1108 (1), β = 90°
c (Å)	4.3475 (2), γ = 90°
Atomic positions	
Mn (x, y, z)	(0.1545, 0.7500, 0.9957)
O1 (x, y, z)	(0.0128, 0.2500, 0.6998)
O2 (x, y, z)	(0.2613, 0.2500, 0.3399)

and analyzed on GSAS-II [5] software. The experiments were carried out under vacuum, while pressure was controlled by an inlet and outlet valve.

2.3. X-ray diffraction

X-ray powder diffraction (XPD) analysis was performed on a Bruker AXS D8 Advance diffractometer (Cu K radiation – λ = 1.54056 Å). The experiment was conducted with a 0.02° step, between 10° and 79.995°. The instrument equipped with a copper target, a Ge (111) primary monochromator, and a solid-state LynxEye detector. The powder diffraction patterns for PrSrMn₂O_{5+δ} was generated using the software Fullprof.

Acknowledgments

The award of UBD Graduate Scholarship (UGS) to Shammya Afroze by Universiti Brunei Darussalam is gratefully acknowledged. The author is extremely grateful to late Professor Sten G. Eriksson, Department of Chemistry and Chemical Engineering, Chalmers University of Technology, Sweden to

give 3 months summer fellowship to work in their laboratories. The author would like to thank the ISIS neutron and muon facility, UK for access to scheduled beam-time (RB1810638, DOI: <https://doi.org/10.5286/ISIS.E.RB1810638>).

Conflict of Interest

The authors declare that they have no known competing financial interests or personal relationships that could have appeared to influence the work reported in this paper.
