

Nuclear Electricity generation in MWh/capita, 2022

Sweden Number One!

March 5, 2023

The failures of nuclear power in France during 2022 made Swedes the people in the world with the largest production of nuclear electricity per capita. This despite Sweden to having one reactor unintentionally offline during the latter half of the year.

Finland, too, seem to have overtaken the most common leading country, France, during 2022.

Using "per capita" measures is the way small countries can compete...

If the French supplier manages to get the 14-year delayed Olkiluoto-3 reactor in Finland to start commercial operation, Finland may become the champion of this competition in the following years.
