Circular manufacturing

Circular Manufacturing (CM) is defined as the implementation **circular strategies** in manufacturers' internal and external activities enabling **resource efficiency, resource life cycle extension, and closed resource loops** while meeting stakeholders' needs.

Definition adapted from Acerbi & Taisch 2020. A literature review on circular economy adoption in the manufacturing sector. *Journal of Cleaner Production*. <https://doi.org/10.1016/j.jclepro.2020.123086>

Evolution of the literature

Searching "circular economy" (CE) and "circular manufacturing" (CM) in title, abstract and keywords in Scopus

➔ Search results: $N_{CE} = 41,427$ documents; $N_{CM} = 151$ documents

Three archetypes

Circular products

Case A1: Eco-innovative product structure and dematerialisation (MyKirei)
Case A2: Affordable circular products (IKEA)
Case A3: Reuse, remanufacture and recycle by design (Ricoh)

Circular processes

Case B1: Durable and remanufactured high-performance equipment (DMG Mori)
Case B2: Resource-efficient and fault-free processes (Kaeser)
Case B3: Recirculation of materials within processes (DyeCoo)

Circular industrial systems

Case C1: Modular circular products and service-based business model (Interface)
Case C2: Responsible material consumption (Nespresso)
Case C3: Industrial symbiosis (Kalundborg Symbiosis)

Manufacturing circular products

Case	A1: MyKirei by Kao	A2: IKEA	A3: Ricoh printers
Material and energy intensity	Dematerialization: lightweight air-fill bottle to reduce plastic by 50% Reduce water and energy use with concentrated formula	Flat-pack designs reduce material waste More compact products to reduce emissions in logistics	Reduce virgin material consumption by reusing parts from old devices Waste toner reuse system ensures unused toner is recovered and put back into machines Reuse 80-90% of machine parts in remanufacturing, lowering both material and energy demand
Toxicity and renewable sources	Plant-based formulas reduce environmental impact	Non-toxic and bio-based materials, waste treatment with minimal environmental impacts Sourcing from FSC-certified wood and recycled materials Investment in renewable energy (wind & solar)	
Recovery and recycling	Recyclable material	Designs for disassembly and recyclability Wood scraps and offcuts reused for new products	Fewer material types to ease separation and recycling Reduce landfill waste by up to 95% through multi-stage reuse and recycling
Durability		Modular furniture concept to extend product life	Offer remanufacturing and refurbishing programs for office equipment
Service intensity	Efficiency in use: bottle designed to reduce leftover product waste	Buy-back and refurbishment programs (Circular Hubs) Encourage customers to return used furniture, repair, resale, and second-life furniture usage	Provide take-back programs for used devices Engage corporate clients to adopt sustainable office solutions

Circular processes

Case	B1: DMG Mori	B2: Kaeser	B3: DyeCoo
Material and energy intensity (+toxicity)	Provide service to support shop floor digitalization for stable machine operation and high productivity	Provide energy-efficient air compressors Suggest an optimal system configuration to reduce the electricity cost	Energy-efficient, water- and chemical free process, hence requiring no wastewater treatment
Recovery and recycling			Recirculation and reuse of supercritical fluid and dyes
Product longevity and durability	Preventive maintenance to prevent machine breakdowns Reconditioning machine and components through retrofit and overhaul	Preventive maintenance including condition-based maintenance based on real-time monitoring of compressors, preventing machine breakdowns	Colour fastness for long-lasting aesthetic properties
Service intensity	Product sales with a 3-year machine insurance to cover repair costs (product-oriented PSS), 2-year warranty + 1-year machine insurance In-person diagnostic service provided by skilled engineers once a year for 3 years Note that some of the service provided for newly purchased machines installed in Japan only	Pay per cubic meter of compressed air (result-oriented PSS) The company's international logistics and service network supply spare parts to reduce downtime	

Industrial systems

Case	C1: Interface	C2: Nespresso	C3: Kalundborg Symbiosis
Material and energy intensity at a system level (supply chains and value networks)	Collaborate with raw material producers to reduce their product's carbon footprint Continuous improvement for reduced material, energy and water consumption in production	Nespresso funded Programme AAA Sustainability Quality Program™ together with Rainforest Alliance to ensure responsible use of resources	Share surpluses of energy, water and materials (usually industrial waste) with other network actors to reduce total consumption of resources
Toxicity and renewable sources	Products made from over 50% recycled and bio-based materials 100% renewable electricity, 61% renewable thermal energy in production Incorporate ocean plastics as valuable material in fibre production	Shift to bio-based, compostable capsules (to replace aluminium) Promote regenerative agricultural practices in coffee farms	Encourage and mobilize investments in decentralized renewable energy production Heat pumps powered by renewable energy sources Careful treatment of all effluents to extract value and ensure safe disposal
Recovery and recycling	Collect post-consumer carpet for reuse, recycling and recovery	Stimulate customers to bring back used capsules to recycle aluminium and reuse used coffee as fertilizer	Collocated industrial companies from different sectors collaborate to share resources so that what would normally be waste for one company becomes value to another
Service intensity	Close operations with vendors and customers to increase accessibility to circular offerings through their business models based on longevity, renewability, reuse, repair, upgrade, refurbish, capacity sharing and dematerialization	Leasing of coffee machines for the period of usage Defective machine brought back to be refurbished and remanufactured (as needed), then resold at the same level of quality as new ones	

Mapping the examples

		Design strategies	Design for reduce	Design for durability	Design for sharing and reuse	Design for reman, refub, repair	Design for recycling and recovery	Design for disposal (safe emissions)
Approaches/principles								
Material	Dematerialisation		A1, B1-2-3, C1					A1, B3
	Durable material			A3, B1-2-3, C1	A2-3, B1-2, C3			
	Recyclable material						A1-2-3, B3, C1-2-3	A1, B3, C1-2-3
	Recycled material		A3				A2-3, B3, C1-2-3	
	Material unification			A3		A2-3, B1-2, C1-2		A1, C3
	Non-hazardous material							A1, B3, C1
	Bio-based and renewable material							A1, B3, C1-3
	Waste reduction		A1-2-3, B3, C2-3					
Energy	Waste valorisation				A2-3, B1-2, C3	A2-3, B1-2, C1-2	A2, B3, C1-2-3	A2, B3, C3
	Energy efficiency and optimization		A3, B1-2-3, C1-3					
	Waste energy recovery		B3, C3				B3, C3	
	Renewable energy source							A2, C1-3
	Low-carbon / carbon-neutral energy source							C1-3
	Carbon offsetting							B3, C2-3
Structure	Durable component			A3, B1-2-3, C1	A3, B1-2	A3, B1-2, C1-2		
	Remanufactured component			A3, B1-2, C1	A2-3, B1-2, C1	A2-3, B1-2, C1-2		
	Enhanced disassemblability				A1-2-3	A2-3	A1-2-3	
	Enhanced accessibility				A2-3, B1-2, C1	A2-3, B1-2, C1	A2-3, C1	
	Modularity and upgradability			A3, B1-2, C1	A2-3, B1-2, C1	A2-3, B1-2, C1-2		
ICT	Process or product monitoring		A3, B1-2-3, C3	A3, B1-2	A3, B1-2, C3	A3, B1-2	A3, C3	A3, B3, C3
	Diagnosis, repair and maintenance			A3, B1-2	B1-2	A3, B1-2		

Closing remarks

- CM is a multifaceted concept
- Proposed three archetypes of the role of manufacturing in a CE
- Towards a unified conceptualization to accelerate CM adoption
